Various views on climate change exist. Many proposals to combat it also exist. Since I hold an unconventional view about the origin of life and the earth [1] some may wonder if I also hold an unconventional view about how to preserve the planet. My view on climate change and how to stop it is:

1. Cellular dust created the universe, the earth and the climate thereof
2. If scientists acknowledge the existence of the microzymas and learn to manipulate them we can terraform the planet to our liking
3. Since microzymas never die, if scientists fail to do the above earth could be ruined-however the microzymas will probably create another earth with new flora, fauna and man.
